www.your_website.com	80	Good	3:45 AM, Nov. 25, 2004 CST

Internet security is becoming an ongoing discipline for community banks; one that requires vigilance 24 hours a day, 7 days a week, 365 days a year to ensure that your website records—and the reputation they support—remain unaltered.

Your website could be defaced without your knowledge, causing bank embarrassment, lost trust and a tarnished brand image. SecurePipe Internet Presence Protection Service will constantly monitor your website content security certificates, email routing and DNS records to detect unplanned or unauthorized changes.

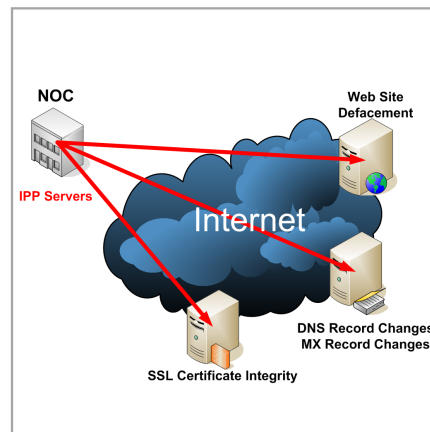

Monitor your site's content for unplanned changes

Monitoring your website's content has become an increasingly important priority. Every website—large and small—can be the target of defacement attacks, which cause the site's content to change. SecurePipe's service will track key aspects of your site's content and notify you in the event of defacement.

Track changes that could indicate a hijacked domain

If a hacker were to gain control of your domain name, they would be in control of your Internet presence. Your site might not load, or worse, it could be replaced by one with objectionable material. This

service is a proactive measure that will ensure your current and potential customers will find your site, as you intended, every time they visit.

Detect an invalid, expired or improperly configured SSL certificate

A Secure Socket Layer (SSL) certificate is crucial to your online business. SecurePipe monitors your SSL certificate, including its configuration, validity and expiration dates,

thereby helping your business to avoid an interruption of sales or damage to your reputation.

Verify email routing records

Just as your website is a large part of your Internet presence, so is your email. Would you know if your email was being rerouted through an attacker? Don't take the chance. Let SecurePipe's Internet Presence Protection help verify that the records responsible for routing email have not changed unintentionally.

* SecurePipe Internet Presence Protection is free for ACB members. Service will be activated upon the completion of a complimentary security review. No purchase is required. Free service will be extended for twelve months from date of activation. For ACB members who enter into a service agreement with SecurePipe after January 1, 2005, Internet Presence Protection Service will be added to the agreement and will be delivered free of charge as long as you remain a SecurePipe customer.

How it works

SecurePipe's Internet Presence Protection Service will continuously monitor your Internet presence for signs of a potential attack. Using website defacement detection technology, SecurePipe's service tracks key aspects of your website's content.** If a potential problem is found, you'll receive immediate notification so you can resolve the issue without further embarrassment. Internet Presence Protection also detects invalid, expired or insecurely configured SSL certificates, tracks domain name record changes and verifies routing records for email.

Why it's effective

Ongoing monitoring and analysis provides assurance that key elements of your Internet presence infrastructure are intact and unmodified. This ongoing monitoring is provided by SecurePipe's Network Operations Center (NOC) where your network will be continuously monitored and a team of trained security professionals are available to assist you 24x7x365 as necessary when any issues arise.

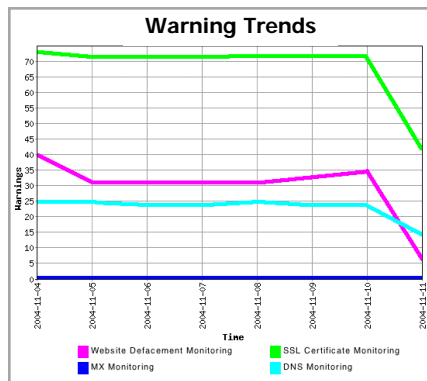

**A website is defined as the document referenced by the primary URL and all pages on the same site that are available within two links of the primary URL.

The benefits

The biggest benefit this service brings is the peace of mind you'll get by knowing that your vigilance is helping to secure your Internet presence. Quick identification warns of possible breaches, enabling an audit of the site and a resolution of the issue.

Results delivered

SecurePipe provides documentation that enables you to demonstrate a responsible security posture to customers, as well as auditors and regulatory authorities. Access to online, real-time reporting enables the delivery of trend reports over customizable time frames. Reporting can be used to provide an audit trail that verifies diligence for management and third-party review.

Internet Presence Protection			
2004-11-04 - 2004-11-11			
Service	In this date range:
